## Transportation System Engineering 2, 10601461

## Chapter 6 <br> Capacity and LOS of Multi-Lane Highways Sections

AN-NAJAH NATIONAL UNIVERSITY NABLUS, PALESTINE

## Multilane Highways

- Multilane highways may exhibit some of the following characteristics:
- Posted speed limits are usually between 60 and $100 \mathrm{~km} / \mathrm{h}$
- They may be undivided or include medians
- They are located in suburban areas or in high-volume rural corridors
- They may include a two-way, left-turn median lane (TWLTL)
- Traffic volumes range from 15,000 to $40,000 /$ day
- Volumes are up to 100,000/day with grade separations and no cross-median access
- Traffic signals at major crossing points are possible
- There is partial control of access

## Multilane Highways

## Typical Capacity Values

Table 13.1: Capacity Under Ideal Conditions for Uninterrupted Flow Facilities

| Type of Facility | Free-Flow Speed <br> $(\mathrm{mi} / \mathrm{h})$ | Capacity |
| :--- | :---: | :---: |
| Freeways | $\geq 70$ | $2,400 \mathrm{pc} / \mathrm{h} / \mathrm{ln}$ |
|  | 65 | $2,350 \mathrm{pc} / \mathrm{h} / \mathrm{ln}$ |
|  | 60 | $2,300 \mathrm{pc} / \mathrm{h} / \mathrm{ln}$ |
|  | 55 | $2,250 \mathrm{pc} / \mathrm{h} / \mathrm{ln}$ |
| Multilane | $\geq 60$ | $2,200 \mathrm{pc} / \mathrm{h} / \mathrm{ln}$ |
| Highways | 55 | $2,100 \mathrm{pc} / \mathrm{h} / \mathrm{hn}$ |
|  | 50 | $2,000 \mathrm{pc} / \mathrm{h} / \mathrm{ln}$ |
|  | 50 | $1,900 \mathrm{pc} / \mathrm{h} / \mathrm{ln}$ |
| Two-Lane | All | $3,200 \mathrm{pc} / \mathrm{h}$ |
| Highways |  | (total, both dir) |
|  |  | $1,700 \mathrm{pc} / \mathrm{h}$ |
|  |  | $(\mathrm{max} . \mathrm{one} \mathrm{dir})$ |

## Multilane Highways

- Any two of the following three performance characteristics can describe the level of service (LOS) for a multilane highway:
$V_{p}$ : Flow rate ( $\mathrm{pc} / \mathrm{h} / \mathrm{ln}$ )
$S$ : Average passenger car speed (mi/h)
$D$ : Density defined as number of cars per mi ( $\mathrm{pc} / \mathrm{mi} / \mathrm{ln}$ )

$$
D=\frac{v_{p}}{S}
$$

Although density is the primary parameter in defining the LOS for Multilane highways

## Multilane Highways

- Following figure illustrates the level-of-service regimes Constant up to $1400 \mathrm{pc} / \mathrm{hr} / \mathrm{In}$

Figure 9.15 Speed-Flow Curves with Level-of-Service Criteria for Multilane Highways

Table 9.33 Level-of-Service Criteria for Multilane Highways

| Free-Flow Speed | Criteria | LOS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A | B | C | D | E |
| $60 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 40 |
|  | Average speed ( $\mathrm{mi} / \mathrm{h}$ ) | 60.0 | 60.0 | 59.4 | 56.7 | 55.0 |
|  | Maximum volume-to-capacity ratio (v/c) | 0.30 | 0.49 | 0.70 | 0.90 | 1.00 |
|  | Maximum service flow rate ( $\mathrm{pc} / \mathrm{h} / \mathrm{ln}$ ) | 660 | 1080 | 1550 | 1980 | 2200 |
| $55 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 41 |
|  | Average speed (mi/h | 55.0 | 55.0 | 54.9 | 52.9 | 51.2 |
|  | Maximum v/c | 0.29 | 0.47 | 0.68 | 0.88 | 1.00 |
|  | Maximum service flow rate (pc/h/ln) | 600 | 990 | 1430 | 1850 | 2100 |
| $50 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 43 |
|  | Average speed ( $\mathrm{mi} / \mathrm{h}$ ) | 50.0 | 50.0 | 50.0 | 48.9 | 47.5 |
|  | Maximum v/c | 0.28 | 0.45 | 0.65 | 0.86 | 1.00 |
|  | Maximum service flow rate (pc/h/ln) | 550 | 900 | 1300 | 1710 | 2000 |
| $45 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 45 |
|  | Average speed (mi/h) | 45.0 | 45.0 | 45.0 | 44.4 | 42.2 |
|  | Maximum v/c | 0.26 | 0.43 | 0.62 | 0.82 | 1.00 |
|  | Maximum service flow rate ( $\mathrm{pc} / \mathrm{h} / \mathrm{ln}$ ) | 480 | 810 | 1170 | 1550 | 1900 |

## Service Flow Rates and Service Volumes

- A Service Flow (SF) Rate is defined as the maximum rate of flow that can be reasonably expected on a lane or roadway under prevailing roadway, traffic, and control conditions while maintaining a particular level of service (LOS).
- Each LOS covers a range of values
- The SF rate is defined as the max. flow rate that can be sustained without exceeding the max.
 density defined for the LOS. There are only 5 SF rates, not 6 .
- LOS F represents unstable flow; exceeds capacity (mostly LOS E).
$\operatorname{LOS} \mathrm{A}$

$\operatorname{LOS} \mathrm{C}$
$\operatorname{LOS} \mathrm{E}$

## Multilane Highways

## Calculating the Flow Rate for a Multilane Highway

- The flow rate in $\mathrm{pc} / \mathrm{h} / \mathrm{ln}$ for a multilane highway is computed as:

$$
v_{p}=\frac{V}{(P H F)(N)\left(f_{p}\right)\left(f_{H V}\right)}
$$

$v_{p}=15$-minute passenger-car equivalent flow rate ( $\mathrm{pc} / \mathrm{h} / \mathrm{ln}$ )
$V=$ hourly peak vehicle volume ( $\mathrm{veh} / \mathrm{h}$ ) in one direction
$N=$ number of travel lanes in one direction (2 or 3)
$f_{p}=$ driver population factor with a range of 0.85 to 1.00 . Use 1.00 for commuter traffic.
If there is significant recreational or weekend traffic, the value is reduced

## Multilane Highways

## Calculating the Flow Rate for <br> a Multilane Highway

$f_{H V}=$ heavy-vehicle adjustment factor (Eq. 9.4)

$$
f_{H V}=\frac{1}{1+P_{T}\left(E_{T}-1\right)+P_{R}\left(E_{R}-1\right)}
$$

$P_{T}$ and $P_{R}=$ decimal portion of trucks/buses and recreational vehicles in the traffic stream
$E_{T}$ and $E_{R}=$ passenger car equivalents. Number of cars using the same space as a truck/bus or a recreational vehicle

## Multilane Highways

## Calculating the Flow Rate for a Multilane Highway

- To estimate $\mathbf{E}_{\mathrm{T}}$ and $\mathbf{E}_{\mathrm{R}}$ There are two situations that must be considered:

1. Extended general segments

$$
\text { Use Table } 9.25
$$

2. Specific grades

- Upgrades: Tables 9.26 and 9.27
- Downgrades: $\mathbf{E}_{\mathbf{T}}$ from Table 9.28 while $\mathbf{E}_{\mathbf{R}}$ are treated as if they were on level terrain

PCEs for trucks \& buses can be determined for three grade conditions:

- 1) extended general segments
- These occur when a single grade is not too long or steep to have significant impact on capacity.
- When grades $\geq 3 \%$ and $<1 / 4 \mathrm{mi}$, or grades $<3 \%$ and $<1 / 2 \mathrm{mi}$
- 2) specific upgrades
- Any segment's grade $\geq 3 \%$ and $>1 / 4 \mathrm{mi}$, or a grade $<3 \%$ and $>1 / 2$ mi , should be considered as a separate segment.
- 3) specific downgrades.
- Composite grades: When a segment of multi-lane highway consists of two or more consecutive upgrades with different slopes, the PCE of heavy vehicles is determined by using :

1. The average grade: by dividing the total rise in elevation by the total horizontal distance. The average grade technique is valid for conditions where grades are $<3 \%$ or the total length of the composite grade is $<4000 \mathrm{ft}$.

## Sample for Average Grade

- The average grade is:

$$
(3.5 \times 2000+5 \times 3000) / 5000=4.4 \%
$$

Or, Total Rise $=0.035 \times 2000+0.05 \times 3000=320 \mathrm{ft}$
Average Grade $=320 / 5000=4.4 \%$

## Multilane Highways

Table 9.25 Passenger-Car Equivalents for Trucks and Buses $\left(E_{T}\right)$ and $\mathrm{RVs}\left(E_{R}\right)$ on General Highway Segments: Multilane Highways and Basic Freeway Sections

| Factor | Type of Terrain |  |  |
| :--- | :---: | :---: | :---: |
|  | Level | Rolling | Mountainous |
| $E_{T}$ (trucks and buses) | 1.5 | 2.5 | 4.5 |
| $E_{R}($ RVs $)$ | 1.2 | 2.0 | 4.0 |

| $>6$ | $>4$ | 7.5 | 6.0 | 5.5 | 4.5 |

Downgrades: $\mathrm{E}_{\mathrm{T}}$ from Table 9.28 while $\mathrm{E}_{\mathrm{R}}$ are treated as if they were on level terrain

- FFS could be field measured (no adjustment), or computed.

Step 1. Compute the Value of Free-Flow Speed. Use Eq. 9.25 to estimate FFS:

$$
\begin{equation*}
F F S=B F F S-f_{L W}-f_{L C}-f_{M}-f_{A} \tag{9.25}
\end{equation*}
$$

where
$F F S=$ estimated free-flow speed (mi/h)
BFFS $=$ base free-flow speed $(\mathrm{mi} / \mathrm{h})$. In the absence of field data, a default value of $60 \mathrm{mi} / \mathrm{h}$ is used for rural/suburban miltilane highways
$f_{L W}=$ adjustment for lane width (Table 9.29)
$f_{L C}=$ adjustment for lateral clearance (Table 9.34)
$f_{M}=$ adjustment for median type (Table 9.35)
$f_{A}=$ adjustment for access-point density (Table 9.36)

| Access Points/Mile | Reduction in FFS <br> $(\mathrm{mi} / \mathrm{h})$ |
| :---: | :---: |
| 0 | 0.0 |
| 10 | 2.5 |
| 20 | 5.0 |
| 30 | 7.5 |
| $\$ 40$ | 10.0 |

- Lateral Clearance: a total from both sides.
- Ideal = 12 ft (6 from each side)
- Maximum accounted for each side is 6 ft
- For example, right side has a LC = 10 ft , left side $=4 \mathrm{ft}$, then total clearance $=6$ (maximum from the right) $+4=$ 10 ft

## Example - Multi-Lane Highway

- A four-lane undivided multilane highway in a suburban area has the following characteristics: posted speed limit $=\mathbf{5 0} \mathbf{~ m i} / \mathrm{h}$; 11 -foot lanes; Lateral clearance $=10 \mathrm{ft}$; 30 access points $/ \mathrm{mi}$ on the right side of the facility. What is the free-flow speed for the direction described?
- Solution:
- Since posted speed limit is $50 \mathrm{mi} / \mathrm{hr}$, the BFFS may be assumed to be 5 or $10 \mathrm{mi} / \mathrm{hr}$ greater
- Assume BFFS = $55 \mathrm{mi} / \mathrm{hr}$
$-\mathrm{f}_{\mathrm{LW}}=1.9 \mathrm{mi} / \mathrm{h}$ (Table 9.29, 11-ft lanes)
$-\mathrm{f}_{\mathrm{LC}}=0.4 \mathrm{mi} / \mathrm{h}$ (Table 9.34)
$-\mathrm{f}_{\mathrm{M}}=1.6 \mathrm{mi} / \mathrm{h}$ (Table 9.35)
$-\mathrm{f}_{\mathrm{A}}=7.5 \mathrm{mi} / \mathrm{h}$ (Table 9.36 access points $/ \mathrm{mi}$ )
- FFS $=55-1.9-0.4-1.6-7.5=43.6 \mathrm{mi} / \mathrm{hr}$

## Example 9.16

## Determining the LOS of a Multilane Highway Segment of Uniform Grade

- A 3200 ft segment of $3.25-\mathrm{mi}$ four-lane undivided multilane highway in a suburban area is at a $1.5 \%$ grade.
- The highway is in level terrain, and lane widths are 11 ft.
- The measured free-flow speed is $46.0 \mathrm{mi} / \mathrm{h}$.
- The peak-hour volume is $1900 \mathrm{veh} / \mathrm{h}, \mathrm{PHF}$ is 0.90 , and there are $13 \%$ trucks and $2 \%$ RVs.
- Determine the LOS, speed, and density for upgrade and downgrade.

## Solution:

- Compute $v_{p}$ using Eqs. 9.4 and 9.22. Input data:

$$
\begin{aligned}
V & =1900 \mathrm{veh} / \mathrm{h} \\
P H F & =0.90 \\
\mathrm{~N} & =2 \\
f_{p} & =1.00 \\
f_{H V} & =0.935 \text { computed from Eq. } 9.4 \\
E_{T} & =1.5, E_{R}=1.2 \text { (Table 9.25) since } 1.5 \text { percent grade is considered level ter- } \\
& \text { rain } \\
P_{T} & =0.13, P_{R}=0.02 \\
f_{H V} & =\frac{1}{1+P_{T}\left(E_{T}-1\right)+P_{R}\left(E_{R}-1\right)} \\
& =\frac{1}{1+0.13(1.5-1)+0.02(1.2-1)}=0.935
\end{aligned}
$$

$$
\begin{aligned}
v_{p} & =\frac{V}{(P H F)(N)\left(f_{p}\right)\left(f_{H V}\right)} \\
& =\frac{1900}{(0.90)(2)(1.00)(0.935)}=1129 \mathrm{pc} / \mathrm{h} / \ln
\end{aligned}
$$

Thus,

$$
S=F F S=46 \mathrm{mi} / \mathrm{h}\left(\text { since } v_{p}<1400\right)
$$

- Compute density from Eq. 9.21.

$$
D=\frac{v_{p}}{S}=\frac{1129}{46}=24.5 \mathrm{pc} / \mathrm{mi} / \mathrm{ln}
$$

LOS C (Table 9.33).

- Compute $v_{p}$ using Eq. 9.21 for the upgrade direction. Input data:

$$
V=1900
$$

intercha $P H F=0.9$

$$
\begin{aligned}
N & =2 \\
f_{p} & =1.00 \\
f_{H V} & =0.905 \text { computed from Eq. } 9.4 \\
E_{T} & =1.5, \text { (Table 9.26) } E_{R}-3.0 \text { (Table 9.27) } \quad \mathrm{E}_{\mathrm{R}}=1.2 \\
P_{T} & =0.13, P_{R}=0.02 \\
f_{H V} & =\frac{1}{1+P_{T}\left(E_{T}-1\right)+P_{R}\left(E_{R}-1\right)} \\
& =\frac{1}{1+0.13(1.5-1)+0.02(3.0-1)}=0.905 \quad \mathrm{f}_{\mathrm{HV}}=0.935 \\
v_{p} & =\frac{V}{(P H F)(N)\left(f_{p}\right)\left(f_{H V}\right)}=\frac{1900}{(0.90)(2)(1.00)(0.905)}=1166 \mathrm{pc} / \mathrm{h} / \mathrm{ln}
\end{aligned}
$$

Thus,

$$
\mathrm{FFS}=46 \mathrm{mi} / \mathrm{h}(\text { since } v<1400)
$$

Compute density from Eq. 9. 21

$$
D=\frac{v_{p}}{S}=\frac{1166}{46}=25.3 \mathrm{pc} / \mathrm{mi} / \mathrm{ln}
$$

## Multi-Lane Highway - Design

- Determine the number of lanes required for a divided multi-lane highway of $0.35-\mathrm{mi}$ long and a $4.5 \%$ grade, if the section is to operate at LOS C. The following design features apply to this section:
- V 3000 veh/h (weekly commuter traffic)
- PHF 0.95
- Trucks and Buses 10\%
- RVs 2\%
- Base Free Flow Speed (BFFS) $=50 \mathrm{mi} / \mathrm{h}$
- Lane width 11 ft
- Lateral obstruction: None
- Access spacing 1 mi (no access within the section)
- Driver population - familiar drivers

Compute free-flow speed.

$$
F F S=B F F S-f_{L W}-f_{L C}-f_{M}-f_{A}
$$

$-\mathrm{BFFS}=50$
$-\mathrm{f}_{\mathrm{LW}}=1.9$
$-f_{L C}=0.0$
$-\mathbf{f}_{\mathrm{M}}=0.0$
$-\mathbf{f}_{\mathrm{A}}=\mathbf{0 . 0}$

- FFS $=50-1.9=48.1 \mathrm{mph}$
- Then, use FFS = 50 mph
- Maximum SF @ LOS C for $S=50 \mathbf{~ m p h}=1300 \mathrm{pc} / \mathrm{hr} / \mathrm{ln}$ (Table 9.33)

Table 9.33 Level-of-Service Criteria for Multilane Highways

## LOS

| Free-Flow Speed | Criteria | LOS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | A | B | C | D | E |
| $60 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 40 |
|  | Average speed $(\mathrm{mi} / \mathrm{h})$ | 60.0 | 60.0 | 59.4 | 56.7 | 55.0 |
|  | Maximum volume-to-capacity ratio (v/c) | 0.30 | 0.49 | 0.70 | 0.90 | 1.00 |
|  | Maximum service flow rate (pc/h/ln) | 660 | 1080 | 1550 | 1980 | 2200 |
| $55 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 41 |
|  | Average speed (mi/h Maximum v/c | $\begin{gathered} 55.0 \\ 0.29 \end{gathered}$ | $\begin{gathered} 55.0 \\ 0.47 \end{gathered}$ | $\begin{gathered} 54.9 \\ 0.68 \end{gathered}$ | $\begin{gathered} 52.9 \\ 0.88 \end{gathered}$ | $\begin{gathered} 51.2 \\ 1.00 \end{gathered}$ |
|  | Maximum service flow rate (pc/h/ln) | 600 | 990 | 1430 | 1850 | 2100 |
| $50 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 43 |
|  | Average speed (mi/h) | 50.0 | 50.0 | 50.0 | 48.9 | 47.5 |
|  | Maximum v/c Maximum service flow rate ( $\mathrm{pc} / \mathrm{h} / \mathrm{ln}$ ) | $\begin{gathered} 0.28 \\ 550 \end{gathered}$ | $\begin{gathered} 0.45 \\ 900 \end{gathered}$ | $\begin{aligned} & 0.65 \\ & 1300 \end{aligned}$ | $\begin{aligned} & 0.86 \\ & 1710^{0} \end{aligned}$ | $\begin{gathered} 1.00 \\ 2000 \end{gathered}$ |
| $45 \mathrm{mi} / \mathrm{h}$ | Maximum density (pc/mi/ln) | 11 | 18 | 26 | 35 | 45 |
|  | Average speed (mi/h) | 45.0 | 45.0 | 45.0 | 44.4 | 42.2 |
|  | Maximum v/c | 0.26 | 0.43 | 0.62 | 0.82 | 1.00 |
|  | Maximum service flow rate ( $\mathrm{pc} / \mathrm{h} / \mathrm{ln}$ ) | 480 | 810 | 1170 | 1550 | 1900 |

## Solution:

Determine PCE equivalents.

$$
\begin{aligned}
& E_{T}=2.0(\text { Table } 9.26) \\
& E_{R}=4.0(\text { Table } 9.27)
\end{aligned}
$$

Compute heavy-vehicle adjustment factor

$$
\begin{aligned}
f_{H V} & =\frac{1}{1+P_{T}\left(E_{T}-1\right)+P_{R}\left(E_{R}-1\right)} \\
f_{H V} & =\frac{1}{1+0.1(2-1)+0.02(4-1)}=0.86
\end{aligned}
$$

Convert vehicle/hour to peak 15-minute passenger-car equivalent flov rate for two, three, and four lanes.

$$
\begin{array}{rl|ll}
v_{P} & =\frac{V}{P H F \times N \times f_{p} \times f_{H V}} & \begin{array}{l}
\text { For } N=3 \\
\text { For } N=4
\end{array} & \begin{array}{l}
v_{p}=1223 \mathrm{pc} / \mathrm{h} / \mathrm{ln} \\
v_{p}=917 \mathrm{pc} / \mathrm{h} / \mathrm{ln}
\end{array} \\
& =\frac{3000}{0.95 \times 2 \times 1.00 \times 0.86} & & \\
& =1834 \mathrm{pc} / \mathrm{h} / \mathrm{ln} & \text { Then, 3 lanes are required }
\end{array}
$$

## Or an alternate way (not highly accurate)

- FFS 48.1 mph (calculated before)
- Density ( $D=v_{p} / S$ ). Maximum $D$ at LOS C $=26$ pe/mi/ln
- $26=v_{p} / 48.1 ; v_{p}=1251 \mathrm{pc} / \mathrm{hr} / \mathrm{ln}$
- $\mathrm{N}=3000$ / ( $\mathbf{1 2 5 1 \times 0 . 9 5 \times 1 . 0 \times 0 . 8 6 ) ~}$
- $\mathrm{N}=2.94$ lanes; 3 lanes are required in each direction
- Another type of question is how much (additional) traffic the highway can accommodate to maintain specific LOS.
- (Example) A 6-lane multi-lane highway with a measured FFS of 47 mph and a directional flow rate of $2000 \mathrm{veh} / \mathrm{hr}$ on rolling terrain and PHF of 0.90. $\mathrm{f}_{\mathrm{HV}}=0.89$. Determine how much additional traffic the highway can accommodate to maintain LOS C?
- Maximum service volume for LOS C $=1170 \mathrm{pc} / \mathrm{hr} / \mathrm{ln}$
- $1170=\mathrm{V} /\{(0.90)(3)(1.0)(0.89)$
- $\mathrm{V}=2812 \mathrm{veh} / \mathrm{hr}$

$$
v_{p}=\frac{V}{(P H F)(N)\left(f_{p}\right)\left(f_{H V}\right)}
$$

- Therefore, additional traffic $=2812-2000=812 \mathrm{veh} / \mathrm{hr}$

## Chapter 6

Capacity and LOS of Multi-Lane Highways and Freeway Sections
